

Input Shaft Shield Kit #ASE-150831

This shield is for units that had older style gear boxes. The older style gear boxes did not have mounting on the top side of the gear boxes.

To install the shield, first remove the top two bolts from the gear box cap that is adjacent to the drive shaft. Use these bolts to secure the shield to the gear box, as shown in the figure below.

Check that the u-joints and the connection area is completely shielded. If there are any questions about this assembly, please contact Hutchinsion Division.
